The Carbon Footprint of Remote Work: Home Energy Versus Commuting

Felix Amundsen-Diallo
Department of Imaginary Studies, Fictional University

Abstract. We compare household energy use and avoided commuting emissions for 1,200 fictional remote workers. Net emissions fall for workers with car commutes over 6 km, but rise for short public-transport commuters in cold climates.

Keywords: remote work, carbon emissions, energy, commuting

Kurgusal örnek veri. AI Agents Masterclass (@selma.builds) için üretildi; gerçek bir yayın değildir.

Method

Smart-meter data combined with commuting surveys.

Results

Average net reduction of 0.9 tonnes CO2 per worker per year, with large variation.

Conclusion

Net emissions fall for workers with car commutes over 6 km, but rise for short public-transport commuters in cold climates.
