Remote Sensing of Crop Productivity With Multispectral Satellite Imagery

Aiko Fernandes, Lukas Brandt
Department of Imaginary Studies, Fictional University

Abstract. We estimate wheat productivity across 2,000 fictional fields using multispectral satellite imagery. A vegetation-index model explains 71 percent of the variation in measured yield.

Keywords: remote sensing, crop productivity, satellite, NDVI

Kurgusal örnek veri. AI Agents Masterclass (@selma.builds) için üretildi; gerçek bir yayın değildir.

Method

Random forest regression on vegetation indices.

Results

Out-of-sample R squared 0.71; errors largest in irrigated fields.

Conclusion

A vegetation-index model explains 71 percent of the variation in measured yield.
